Concurrent Programming

Concurrent Threads

Two threads are concurrent if their flows overlap in

time

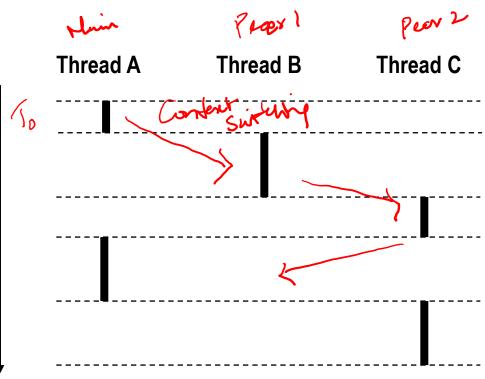

Otherwise, they are sequential

Examples:

Concurrent: A & B, A&C

Sequential: B & C

Time

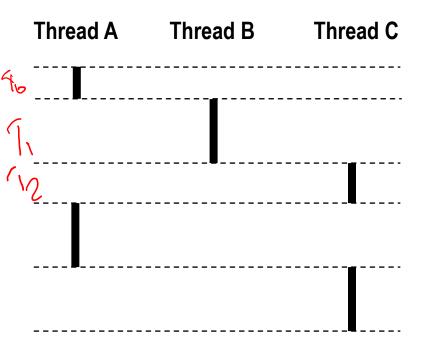

Concurrent Thread Execution

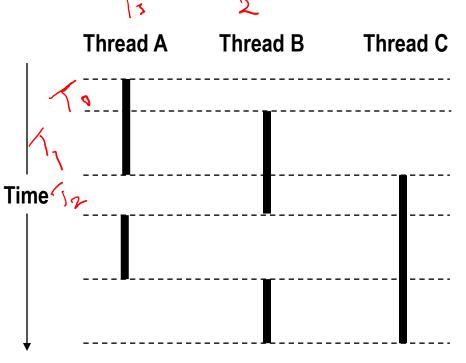

Single Core Processor

Simulate parallelism by time slicing

Multi-Core Processor

Can have true parallelism

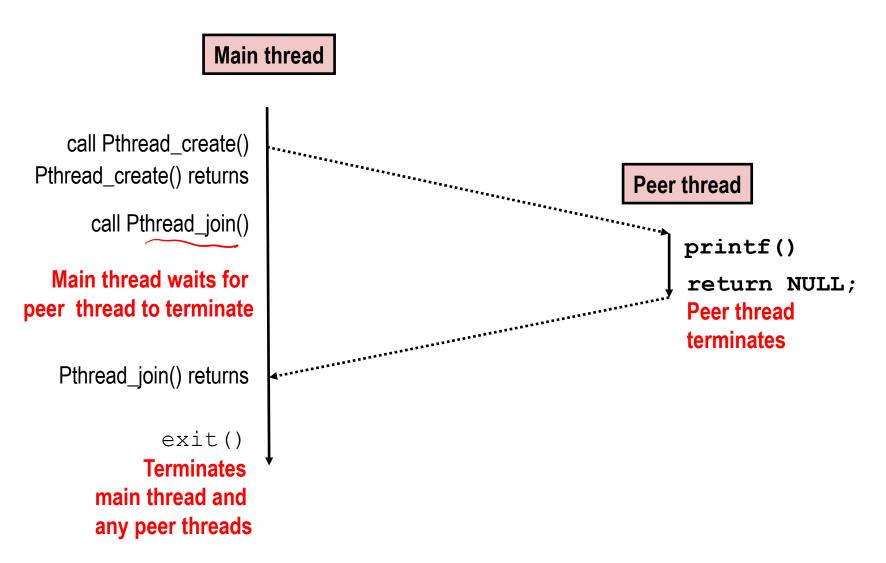

The Pthreads "Hello, world!" program

```
#include "csapp.h"
void *thread(void *vargp);
    int main()
        pthread_t tid;
         Pthread_create(&tid, NULL, thread, NULL);
        Pthread_join(tid, NULL);
8
         exit(0):
10
11
    void *thread(void *vargp) /* Thread routine */
12
13
        printf("Hello, world!\n");
14
        return NULL;
15
    }
16
```

Execution of Threaded "hello, world"

Threads Memory Model

Conceptual model:

- Multiple threads run within the context of a single process
- Each thread has its own separate thread context
 - Thread ID, stack, stack pointer, PC, condition codes, and GP registers
- All threads share the remaining process context
 - Code, data, heap, and shared library segments of the process virtual address space
 - Open files and installed handlers

Operationally, this model is not strictly enforced:

- Register values are truly separate and protected, but...
- Any thread can read and write the stack of any other thread

The mismatch between the conceptual and operation model is a source of confusion and errors

Mapping Variable Instances to Memory

Global variables

- Def: Variable declared outside of a function
- Virtual memory contains exactly one instance of any global variable

Local variables

- Def: Variable declared inside function without static attribute
- Each thread stack contains one instance of each local variable

Local static variables

- Def: Variable declared inside function with the static attribute
- Virtual memory contains exactly one instance of any local static variable.

Mapping Variable Instances to Memory

```
voltralne. 17th
 Global var: 1 instance (ptr [data])
                                          Local vars: 1 instance (1.m. msgs.m)
                                                                   Prem
char **ptr; /* global var */
                                                  Local var: 2 instances
                                                                 [peer thread 0's stack],
                                                     myid.p0
int main()
                                                                 peer hread 1's stack]
                                                     myid.pl
  long i;
  pthread t tid;
  char *msgs[2] = {
                                                  void *thread(void/*vargp)
    "Hello from foo",
    "Hello from bar"
  };
                                                    long myid = (long)vargp;
                                                    static int cnt = 0;
  ptr = msgs;
  for (i = 0; i < 2; i++)
                                                    printf("[%ld]: %s (cnt=%d)\n",
    Pthread create(&tid,
                                                       myid, ptr[myid], +/+cnt);
      NULL,
                                                    return NULL;
      thread,
      (void *)i);
                                                        Local static var: 1 instance (cnt [data])
  Pthread_exit(NULL);
                                    sharing.c
```

Shared Variable Analysis

Which variables are shared?

| Variable instance | Referenced by main thread? | Referenced by peer thread 0? | Referenced by peer thread 1? |
|-------------------|----------------------------|------------------------------|------------------------------|
| ptr | yes | yes | yes |
| cnt | no | yes | yes |
| i.m | yes | no | no |
| msgs.m | yes | yes | yes |
| myid.p0 | no | yes | no |
| myid.p1 | no | no | yes |

- Answer: A variable x is shared iff multiple threads reference at least one instance of x. Thus:
 - ptr, cnt, and msgs are shared
 - i and myid are *not* shared

Synchronizing Threads

- Shared variables are handy...
- ...but introduce the possibility of nasty synchronization errors.

badcnt.c: Improper Synchronization

```
/* Global shared variable */
volatile long cnt = 0; /* Counter */
int main(int argc, char **argv)
  long niters;
  pthread_t tid1, tid2;
  niters = atoi(argv[1]);
  Pthread create(&tid1, NULL,
    thread, &niters);
  Pthread create(&tid2, NULL,
    thread, &niters);
  Pthread join(tid1, NULL);
  Pthread join(tid2, NULL);
  /* Check result */
  if (cnt != (2 * niters))
    printf("BOOM! cnt=%ld\n", cnt);
  else
    printf("OK cnt=%ld\n", cnt);
  exit(0);
                                                badcnt.c
```

```
linux> ./badcnt 10000
OK cnt=20000
linux> ./badcnt 10000
BOOM! cnt=13051
linux>
```

cnt should equal 20,000.

What went wrong?

Assembly Code for Counter Loop

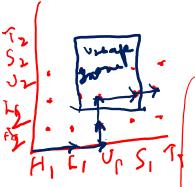

Muhral exchum,

Leaders deather

C code for counter loop in thread i

```
for (i = 0; i < niters; i++)
     cnt++;</pre>
```

H 21 L 2 V & 2 T2

Asm code for thread i

```
movq (%rdi), %rcx
testq %rcx,%rcx
jle .L2
movl $0, %eax
.L3:
movq cnt(%rip),%rdx
addq $1, %rdx
movq %rdx, cnt(%rip)
addq $1, %rax
cmpq %rcx, %rax
jne .L3
.L2:
```

H_i: Head

 L_i : Load cnt U_i : Update cnt S_i : Store cnt

. *T_i* : Tail

Enforcing Mutual Exclusion

- Question: How can we guarantee a safe trajectory?
- Answer: We must synchronize the execution of the threads so that they can never have an unsafe trajectory.
 - i.e., need to guarantee mutually exclusive access for each critical section.
- Classic solution:
 - Semaphores ()

Semaphores

- Semaphore: non-negative global integer synchronization variable. Manipulated by P and V operations.
- P(s)
 - If *s* is nonzero, then decrement *s* by 1 and return immediately.
 - Test and decrement operations occur atomically (indivisibly)
 - If s is zero, then suspend thread until s becomes nonzero and the thread is restarted by a V operation.
 - After restarting, the P operation decrements s and returns control to the caller.
- V(s):
 - Increment s by 1.
 - Increment operation occurs atomically
 - If there are any threads blocked in a P operation waiting for s to become non-zero, then restart exactly one of those threads, which then completes its P operation by decrementing s.
- Semaphore invariant: (s >= 0)

C Semaphore Operations

Pthreads functions:

```
#include <semaphore.h>
int sem_init(sem_t *s, 0, unsigned int val);} /* s = val */
int sem_wait(sem_t *s); /* P(s) */
int sem_post(sem_t *s); /* V(s) */
```

CS:APP wrapper functions:

```
#include "csapp.h"

void P(sem_t *s); /* Wrapper function for sem_wait */
void V(sem_t *s); /* Wrapper function for sem_post */
```

badcnt.c: Improper Synchronization

```
/* Global shared variable */
volatile long cnt = 0; /* Counter */
int main(int argc, char **argv)
  long niters;
  pthread t tid1, tid2;
  niters = atoi(argv[1]);
  Pthread create(&tid1, NULL,
    thread, &niters);
  Pthread create(&tid2, NULL,
    thread, &niters);
  Pthread join(tid1, NULL);
  Pthread join(tid2, NULL);
  /* Check result */
  if (cnt != (2 * niters))
    printf("BOOM! cnt=%ld\n", cnt);
  else
    printf("OK cnt=%ld\n", cnt);
  exit(0);
                                                 badcnt.c
```

How can we fix this using semaphores?

Using Semaphores for Mutual Exclusion

Basic idea:

- Associate a unique semaphore mutex, initially 1, with each shared variable (or related set of shared variables).
- Surround corresponding critical sections with P(mutex) and V(mutex) operations.

Terminology:

- Binary semaphore: semaphore whose value is always 0 or 1
- Mutex: binary semaphore used for mutual exclusion
 - P operation: "locking" the mutex
 - Toperation: "unlocking" or "releasing" the mutex
 - "Holding" a mutex: locked and not yet unlocked.
- Counting semaphore: used as a counter for set of available resources.

goodcnt.c: Proper Synchronization

Define and initialize a mutex for the shared variable cnt:

```
volatile long cnt = 0; /* Counter */
sem_t mutex; /* Semaphore that protects cnt */
Sem_init(&mutex, 0, 1); /* mutex = 1 */
```

Surround critical section with P and V:

```
linux> ./goodcnt 10000
OK cnt=20000
linux> ./goodcnt 10000
OK cnt=20000
linux>
```

Warning: It's orders of magnitude slower than badent.c.
